Environmental Engineering Sewage Disposal And Air Pollution Engineering
 Clean water is one of the most important natural resources on earth. Wastewater, which is spent water, is also a valuable natural resource. However, wastewater may contain many contaminants and cannot be released back into the environment until the contaminants are removed. Untreated wastewater and inadequately treated wastewater may have a detrimental effect on the environment and has a harmful effect on human health. Water quality engineering addresses the sources, transport and treatment of chemical and microbiological contaminants that affect water. Objectives for the treatment of wastewater are that the treated wastewater can meet national effluent standards for the protection of the

environment and the protection of public health. This book, which is based on the Special Issue, includes contributions on advanced technologies applied to the treatment of municipal and industrial wastewater and sludge. The book deals with recent advances in municipal wastewater, industrial wastewater, and sludge treatment technologies, health effects of municipal wastewater, risk management, energy efficient wastewater treatment, water sustainability, water reuse and resource recovery. *Air and Water Purification and Pollution Control Equipment* Springer Science & Business Media
 Indexes material from conference proceedings and hard-to-find documents, in addition to journal articles. Over 1,000 journals are indexed and literature published from 1981 to the present is covered. Topics in pollution and its

management are extensively covered from the standpoints of atmosphere, emissions, mathematical models, effects on people and animals, and environmental action. Major areas of coverage include: air pollution, marine pollution, freshwater pollution, sewage and wastewater treatment, waste management, land pollution, toxicology and health, noise, and radiation.

Waste management is the collection, transport, processing or disposal, managing and monitoring of waste materials. The term usually relates to materials produced by human activity, and the process is generally undertaken to reduce their effect on health, the environment or aesthetics. Waste management is a distinct practice from resource recovery which focuses on delaying the rate of consumption of natural resources. The management of wastes treats all materials as a single class, whether solid, liquid, gaseous or radioactive substances, and tried to reduce the harmful environmental impacts of each through different methods. Rapid industrialization last few decades have led to the depletion of pollution of precious natural resources in India depletes and pollutes resources continuously. Further the rapid industrial developments have, led to the generation of huge quantities of hazardous wastes, which have further aggravated the environmental problems in the country by depleting and polluting natural resources. In fact, man today is caught in the vicious circle of increasing wants, declining resources and increasing waste being generated by the industries and municipalities is posing a problem of enormous dimensions. The domestic and industrial effluents are contributing in enhancing this problem. It might become the biggest problem if it is not dealt with immediately. Therefore, rational and sustainable utilization of natural resources and its protection from toxic releases is vital for sustainable socioeconomic development. Hazardous waste management is a new concept for most of the Asian countries including India. The utilization of resources and generation of waste is for beyond the limit that the biosphere was made to carry. This book majorly deals with industrial waste, industrial waste water technology, modern technologies for water pollution control, water recycle & product recovery air pollution control, environmental management system (EMS), surface active agents and contamination of water, physical methods for the treatment of organic acid bearing wastes, realities of waste cyanide treatment in India, biological treatment of aqueous wastes, plastics and generated wastes, alginate

industry waste a source of biogas, acid charred waste as a resource material for highly active adsorbent. We have made a sincere effort to bring out this book which helps in minimizing the problem. For the conservation of our environment and sustainable development, we have tried to bring about the solution. This book is a careful attempt in bringing together some selected articles from both entrepreneurs and specialist on all that is possible in the field of waste management.

"This book is an attempt to present those essential principles and present day practice necessary to solution of the problems of water collection, water purification, water distribution, waste water collection, treatment and disposal, solid waste management, Air and Noise pollution. This book is generally subdivided into 5 sections i.e. Water supply engineering, waste water engineering, Municipal Solid waste, Noise pollution and Air pollution. A large portion of the material presented in this book has been derived from the work of others. Their contribution is greatly acknowledged. The recommendations of various Indian Standards on the subject, along with those of manual on Water supply and treatment, manual on Sewerage and Sewage Treatment prepared by the Central Public Health and Environmental Engineering Organisation under the ministry of Urban development have been closely followed." *Environmental Health Planning Guide* Akbar Ziauddin

Environmental engineers support the well-being of people and the planet in areas where the two intersect. Over the decades the field has improved countless lives through innovative systems for delivering water, treating waste, and preventing and remediating pollution in air, water, and soil. These achievements are a testament to the multidisciplinary, pragmatic, systems-oriented approach that characterizes environmental engineering. *Environmental Engineering for the 21st Century: Addressing Grand Challenges* outlines the crucial role for environmental engineers in this period of dramatic growth and change. The report identifies five pressing challenges of the 21st century that environmental engineers are uniquely poised to help advance: sustainably supply food, water, and energy; curb climate change and adapt to its impacts; design a future without pollution and waste; create efficient, healthy, resilient cities; and foster informed decisions and actions.

The book covers the important aspects of water, air and noise pollution. Using a multidisciplinary approach, it highlights the impact of environmental pollution in the world. It also suggests methods for controlling and scientific monitoring of pollution-causing agents. Also included are chapters on efficient guidelines and standards, radioactive waste, solid waste disposal and sewage treatment, oil pollution and role of insecticides. Pollution in tanneries, fertilizer industry, and pulp and paper industries is also covered. The last few chapters are devoted to environmental management, benefit-cost analysis and mathematical modelling for environmental pollution control *Environmental Engineering: Review for the Professional Engineering Examination* Courier Corporation

The Handbook of Environmental Health-Pollutant Interactions in Air, Water, and Soil includes Nine Chapters on a variety of topics basically following a standard chapter outline where applicable with the exception of Chapters 8 and 9. The outline is as follows: 1. Background and status 2. Scientific, technological and general information 3. Statement of the problem 4. Potential for intervention 5. Some specific resources 6. Standards, practices, and techniques 7. Modes of surveillance and evaluation 8. Various controls 9. Summary of the chapter 10. Research needs for the future Chapter 1, Air Quality Management discusses various clean air acts, toxic air pollutants, the various types of pollutants, the composition of the atmosphere, global warming, ozone depletion, various atmospheric regions, air currents and movement, air temperature, inversions, urban and topographic effects, weather, physical properties of gases including various laws, psychometric properties of air, particulate matter, settling velocity of particles, particle retention in lungs, alteration and transportation of particulate matter, bubble concept. It also discusses various regulated air pollutants including nitrogen oxides, sulfur oxides, carbon monoxide, carbon dioxide, a range of hydrocarbons both aliphatic and aromatic, photochemical oxidants, organic gaseous discharges, simplified reactions in the atmosphere, ozone, methyl bromide, lead, asbestos, beryllium, cadmium, mercury, fluorides, odors. Air pollutants from incinerators, cement kilns, backyard burning, external combustion, internal combustion, attrition, evaporation, incineration, pulp and paper mills, iron and steel mills, petroleum refineries, metallurgical industries, chemical manufacturers, power plants, food and agricultural industries are also included.

Air toxics and hazardous air pollutants are of considerable significance. Major source categories of air pollutants are discussed. There is a significant amount of material on disease and injury potential from air pollutants and a discussion of the respiratory system, the eye, systemic effect, digestive system. Economic effects are discussed including problems of visibility, acid deposition, global atmospheric changes. The latest standards, practices and techniques used for all of the air pollutants discussed as well as modes of surveillance and evaluation are in the text. Air pollution controls and state-of-the-art graphics are utilized to better understand how to control various air pollutants. Chapter 2, Solid and Hazardous Waste Management discusses residential waste, commercial waste, municipal waste, institutional and research laboratory waste, infectious and medical waste, industrial waste, food waste, yard waste, food processing waste, metal waste, paper, plastics, glass, wood, aluminum, chemical waste, rubber, radioactive waste, mining waste, agricultural waste, recreational waste, abandoned automobiles, packaging materials, refuse-derived fuels, heavy metals, toxic releases. It also discusses in detail pollution prevention and waste minimization, municipal solid waste reduction, Hazardous Waste and Resource Conservation and Recovery Act, Emissions Standards for Hazardous Air Pollutants, solid waste storage systems, on-site volume reduction systems, central volume reduction systems. Various collection systems, individual, community, industrial, agricultural are included. Sanitary landfills and the attendant problems are discussed in detail. Other concerns include types and properties of solid waste, hydrology and climatology, soils and geology, planning and design of landfills, site selection, types of soils, equipment, converting landfill gas and electricity. Incineration of various types are discussed including air emissions, general design of equipment, residue analysis and, incinerator process water, special waste handling. Composting and biological treatment includes physical and chemical processes, biological processes, different compost systems, innovative uses of compost. Pyrolysis includes pyrolysis oils, carbon black, reclamation and recycling. The disposal of solid waste includes the problems of land pollution, water pollution, air pollution, spread of disease through the waste and by means of insects and rodents. Chemical hazards in the human environment include endocrine disruptors, dioxins, other hazardous waste, injuries and occupational

hazards. Types of hazardous waste include ignitable, corrosive, reactive, toxic waste. Hazardous waste transportation, waste discharge hazards, underground storage tanks are also discussed. Toxics release inventory, material handling technologies are significant. Redeveloping Brownfields are important. Standards, practices, and techniques are available for all forms of solid and hazardous waste disposal. The Superfund and the various acts related to it, are discussed. Study and evaluation techniques as well as controls and treatment techniques are an essential part of the material. Employee protection programs as well as other solid and hazardous waste programs and integrated techniques of disposal are part of the material. Chapter 3, Private and Public Water Supplies discusses the most recent laws and water quality. It also discusses the hydrologic cycle, human impact on the water cycle, hydrogeology, geographic information system, EnviroMapper, global positioning system. There is an extensive discussion of water treatment including chemical reactions, dosage and concentration terminology, environmental concerns, water distribution, wells, ponds or lakes, springs, rivers. Water treatment plants include state-of-the-art graphics of water intake, aeration, sedimentation, filtration, chlorination, storage including reservoirs where discussions of hypochlorination of water, ozone, aeration, chlorine, chlorine dioxide are described. Water supply problems include physical problems, chemical hazards, radiological hazards, groundwater and surface water relationships, groundwater contamination, public water system contamination by injection wells, polycyclic aromatic hydrocarbons, volatile organic compounds, gasoline. There is a discussion of risk assessment and risk management of water supplies. Biological factors include waterborne disease outbreaks, E. Coli O157: H7 and Campylobacter outbreaks. Standards, practices, and procedures are established for safe drinking water. There's a discussion and state-of-the-art graphics of dug or bored wells, driven wells, plumbing, drilled wells, well construction, well pumps, storage of well water, well testing, well disinfection, chlorination equipment, filters. Water treatment plant surveys, mapping programs for groundwater supplies, waterborne disease investigation are essential. Appropriate survey forms and US EPA studies and techniques are included. New technologies in water treatment are important. Chapter 4, Swimming Areas discusses water treatment, sources of water supply, pool

hydraulic system, disinfection, swimming pool chemistry, chemistry of ozone in water, swimming pool calculations, therapeutic pools, bathing beaches and microbiological characteristics, recent outbreaks of disease, potential safety problems, current standards, practices and techniques, pool plans review, pool equipment, filtration systems, chemical feed, water testing, inspection techniques all accompanied by appropriate state-of-the-art graphics. Chapter 5, Plumbing discusses basic principles of plumbing related to environmental health, principles of hydraulics, cross connections, back flow, plumbing problems of public health significance, interceptors, separators, backwater valves, indirect and special waste, water supply and distribution systems, drainage systems, liquid medical waste, geothermal heat pump systems, tests and maintenance, means of preventing backflow, uniform plumbing code. Chapter 6, Private and Public Sewage Disposal and Soils discusses sources of sewage, appearance and composition of sewage, dissolved gases, biological composition of sewage, oxygen demand in sewage, chemical changes in sewage composition, decomposition of organic matter in sewage, biological sludges, sewage disposal concepts, sewage contaminants in groundwater, holding tank concept, sewage system infrastructure, primary treatment, secondary sewage treatment techniques including trickling filter systems, activated sludge process, rotating biological contactors, contact aeration process, intermittent sand filters, stabilization ponds, chlorination of sewage. Sludge digestion, treatment, and disposal techniques are discussed in depth. Advanced water treatment techniques, suspended solids removal, adsorption, oxidation, foam separation, distillation, electro dialysis, freezing, ion exchange, reverse osmosis, phosphate removal, nitrate removal are discussed. Package treatment plants are included. There is a substantial discussion of the topic of soils including soil profile, soil formation and composition, properties and qualities of soils, soil texture, permeability, soil structure, shrink-swell potential, classification and naming of soils, characteristic used to differentiate soils, effluents from septic tanks and soils, reduction of sewage effluent by soil, evapotranspiration and climate, soil-clogging effects of septic tank effluents, soil cleaning technologies, soil surveys. Equipment and systems are described in depth including septic tanks, aerobic tank systems, dosing tanks, soil absorption

systems, and all forms of municipal treatment systems. State-of-the-art graphics is used throughout the chapter to highlight the information. Chapter 7, Water Pollution and Water Quality Controls discusses all of the federal laws related to water, water pollution, water quality and clean water. It also discusses wetlands, coastal waters, estuaries, the ocean, the effects of heat, acidity and alkalinity, conductivity, chemical oxygen demand-biological oxygen demand-dissolved oxygen relationships, solids and water pollution, nutrients and water pollution, water resource problems, pollutants and their sources, municipal waste, ocean pollution, National Eutrophication Study, non-point source pollution of all types, pesticides. There is a substantial discussion of the major point sources of pollution, techniques used to measure the levels of pollution and appropriate controls. The type of pollutants include oxygen-depleting wastes, toxic and hazardous wastes, waste causing physical damage, waste producing tastes and odors, waste containing inorganic dissolved solids, plant nutrients, radioactive wastes, corrosive wastes, pathogenic wastes, thermal pollution, dredging waste, sedimentation wastes, oil, mining drainage, feedlot pollution, waste from watercraft, irrigation. Public health aspects of water pollution include a large variety of biological hazards, bacterial, viral, protozoa, helminths, microorganisms in shellfish and microorganisms in wastewater aerosols. Chemical hazards include a large number of chemical substances potentially hazardous to humans through either drinking water or the food chain. They are trihalomethanes, MTBE and other airborne volatile organic compounds, polychlorinated biphenyls, pesticides, other organic compounds, potential mutagens in wastewater and sludge, toxic organics from homes, organics found in raw municipal wastewater, organics found in raw municipal sludge, organics found in soil and groundwater, heavy metals in sludge, detergents. Standards, practices and techniques related to fish and wildlife areas, swimming areas are included. Public water supplies are discussed in Chapter 3. There is a significant presentation on proper sludge disposal as well as land application of sewage sludge. Wastewater treatment techniques are provided for biological waste and chemical waste. Chapter 8, Terrorism and Environmental Health Emergencies discusses the nature of terrorism, various types of terrorist acts including biological, chemical, nuclear, radiological, electrical

systems, agricultural, cyber. The Strategic Plan for Preparedness and Response and the National Strategy for Combating Terrorism which was published December 15, 2000 is discussed in detail. Also included is the Strategic Plan of the Centers for Disease Control from the year 2000 as well as US Government Interagency Domestic Terrorism Concept of Operations Plan of January 2001. In addition disasters and how best to deal with them including earthquakes, floods, forest fires, hurricanes, landslides, radiological spills, tornadoes and windstorms are part of the chapter. There is a discussion of the Emergency Planning and Community Right to Know Law, Federal Emergency Management Agency, emergency management at the state level, National Disaster Medical System, disaster response guidelines for ambulance providers, community disaster plans, hospital disaster plans, emergency vehicles and emergency communications systems, environmental response teams, mental health needs and disasters. Specific environmental health measures are established for housing, food, water, insect and rodent control, sewage, solid and hazardous waste, radiation. Chapter 9, Major Instrumentation for Environmental Evaluation of Ambient Air, Water, and Soil discusses techniques for collecting soil samples, water samples, air samples for particulates, air samples for gases and vapors, remote monitoring of gases, vapors, and particulates, stack sampling for gases, vapors and particulates. Sample analysis techniques are presented for soil and water samples. State of the art graphics are utilized to help understand sampling techniques. A large and current bibliography by chapter is included at the end of the book. The state-of-the-art computerized graphics produced by internationally acclaimed artist, can be found throughout the book. A comprehensive index of both volume II and volume I is at the end of the book to aid the reader in easily finding necessary information. The reader is referred to volume I when appropriate. The book is user-friendly to a variety of individuals including generalists professionals as well as specialists, industrial hygiene personnel, health and medical personnel, the media, supervisors and managers of environmental health and occupational health areas, and students. Individuals can easily gain appropriate and applicable standards, rules and regulations to help the individual increase knowledge in a given area or solve actual problems. The book is utilized to help individuals also prepare for registration examinations. The

book is co-published with the National Environmental Health Association.

During the last two decades, the environmental pollution regulations have undergone a vast change. Attempts have been made to refine the conventional technologies and to develop new technologies to meet increasingly more stringent environmental quality criteria. The challenge that one faces today is to meet these stringent requirements in an environmentally acceptable and cost effective manner. The present book addresses the application of the state-of-the-art technology to the solutions to today's problems in industrial effluent pollution control and environmental protection. The highlight of this book is the inclusion of the salient features of process modifications and other important methods and techniques for the minimization of wastes. The chapter on process modification for waste minimization provides new technical features and tools, latest technologies and techniques, and other industrial operations. Besides, the text covers the role of an environmental engineer in the methodology for making pollution control decisions. **KEY FEATURES :** Includes numerous self-explanatory tabular and diagrammatic representations. Presents pollution problems of few chemical and processing industries. Provides case studies on environmental pollution problems and their prevention. Analyzes thoroughly the planning and strategies of environmental protection. Designed as a textbook for the undergraduate students of civil and chemical engineering, this book will also be useful to the postgraduate students of environmental science and engineering.

This Handbook is an authoritative reference for process and plant engineers, water treatment plant operators and environmental consultants. Practical information is provided for application to the treatment of drinking water and to industrial and municipal wastewater. The author presents material for those concerned with meeting government regulations, reducing or avoiding fines for violations, and making cost-effective decisions while producing a high quality of water via physical, chemical, and thermal techniques. Included in the texts are sidebar discussions, questions for thinking and discussing, recommended resources for the reader, and a comprehensive

glossary. Two companion books by Cheremisinoff are available: Handbook of Air Pollution Control Technologies, and Handbook of Solid Waste Management and Waste Minimization Technologies. * Covers the treatment of drinking water as well as industrial and municipal wastewater * Cost-efficiency considerations are incorporated in the discussion of methodologies * Provides practical and broad-based information in one comprehensive source

Modern Technology Of Waste Management: Pollution Control, Recycling, Treatment & Utilization
Pearson Higher Ed

Multidisciplinary treatment of the urgent issues surrounding urban pollution worldwide Written by some of the top experts on the subject in the world, this book presents the diverse, complex and current themes of the urban pollution debate across the built environment, urban development and management continuum. It uniquely combines the science of urban pollution with associated policy that seeks to control it, and includes a comprehensive collection of international case studies showing the status of the problem worldwide. Urban Pollution: Science and Management is a multifaceted collection of chapters that address the contemporary concomitant issues of increasing urban living and associated issues with contamination by offering solutions specifically for the built environment. It covers: the impacts of urban pollution; historical urban pollution; evolution of air quality policy and management in urban areas; ground gases in urban environments; bioaccessibility of trace elements in urban environments; urban wastewater collection, treatment, and disposal; living green roofs; light pollution; river ecology; greywater recycling and reuse; containment of pollution from urban waste disposal sites; bioremediation in urban pollution mitigation; air quality monitoring; urban pollution in China and India; urban planning in sub-Saharan Africa and more. Deals with both the science and the relevant policy and management issues Examines the main sources of urban pollution Covers both first-world and developing world urban pollution issues Integrates the latest scientific research with practical case studies Deals with both legacy and emerging pollutants and their effects The integration of physical and environmental sciences, combined with social, economic and political sciences and the use of case studies makes Urban Pollution: Science and Management an incredibly useful resource for policy

experts, scientists, engineers and those interested in the subject.

Water Supply, Waste Disposal, and Pollution Control National Academies Press

Environmental engineering has a leading role in the elimination of ecological threats, and can deal with a wide range of technical and technological problems due to its interdisciplinary character. It uses the knowledge of the basic sciences - biology, chemistry, biochemistry and physics - to neutralize pollution in all the elements of the environment, i.e. the hydrosphere, atmosphere and lithosphere. Mainly, environmental engineering deals with the design and maintenance of systems of water supply, sewage disposal, heating, ventilation and air-conditioning in buildings. In brief, it deals with securing technically, the conditions which create a safe environment for mankind to live in. The three main goals of Environmental Engineering III are to assess the state of scientific research in various areas of environmental engineering; to evaluate organizational, technical, and technological progress in contributing to ecological security; and to determine the place of environmental engineering in sustainable development, taking into account current political and economic conditions. The contributions are divided into eight sections: General problems Air pollution control Indoor air pollution control Neutralization of sewage sludge and wastewater Neutralization of solid wastes and sludges Remediation of polluted sites Water quality and supply Energy saving and recovery Environmental Engineering III contains 88 selected and peer reviewed papers from 327 contributions presented during the 3rd Congress of Environmental Engineering, and is a valuable sources of information for academics and engineers in environmental engineering.

Sewage Disposal And Air Pollution Engineering CRC Press

The past 30 years have seen the emergence of a growing desire worldwide to take positive actions to restore and protect the environment from the degrading effects of all forms of pollution: air, noise, solid waste, and water. Because pollution is a direct or indirect consequence of waste, the seemingly idealistic demand for "zero discharge" can be construed as an unrealistic demand for zero waste. However, as long as waste exists, we can only attempt to abate the subsequent pollution by converting it to a less noxious form. Three major questions usually arise when a particular type of pollution has been identified: (1) How

serious is the pollution? (2) Is the technology to abate it available? and (3) Do the costs of abatement justify the degree of abatement achieved? The principal intention of the Handbook of Environmental Engineering series is to help readers formulate answers to the last two questions. The traditional approach of applying tried-and-true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering, and has accounted in large measure for the establishment of a "methodology of pollution control." However, realization of the ever-increasing complexity and interrelated nature of current environmental problems makes it imperative that intelligent planning of pollution abatement systems be undertaken.

Water And Waste Water Engineering, Municipal Solid Waste, Air And Noise Pollution Van Nostrand Reinhold Company "A treatment of 15 topics of great contemporary relevance by bestselling author S. A. Abbasi. Each topic is covered from its basics to its global application in a highly concise and compact yet exceedingly clear and lucid style. The coverage has a wide sweep, reflective of the great diversity and complexity of challenges presently faced by the Earth's environment. Some of the biggest existence-threatening questions are also addressed in this book - for example: Is renewable energy as safe for the world as is believed? Can technology make the present paradigm of development sustainable? Will a shift to renewables halt global warming? Is fossil fuel decarbonization really workable? Current Concerns in Environmental Engineering would enhance the comprehension of undergraduate and graduate students while giving them a worldview that formal textbooks generally fail to do. The book will be exceedingly useful to teachers and researchers due to the fresh insights it can give and the innovative thinking it can stimulate. The book is profusely illustrated with dramatic as well as aesthetically pleasing visuals. Besides capturing the interest of the reader the visuals also enhance the reader's comprehension and appreciation of the text"--

This title, first published in 1990, is intended to assess the impact of national environmental control policies on international trade and competitiveness in general, and, in particular, the impact of differential environmental control policies on the international trade and competitiveness of the two industrialized nations, Germany and the United States. To assess the impact of differential environmental control policies on trade, this study applies a comparative analysis of the two countries.

Water treatment describes those processes used to make water more acceptable for a desired end use. These can include use as drinking water, industrial processes, medical and many other uses. The goal of all water treatment process is to remove existing contaminants in the water, or reduce the concentration of such contaminants so the water becomes fit for its desired end use. Water quality analytical techniques are considered in the context of EEC directives on the quality of the aquatic control of all effluents is entering it. The principal methods of water analysis are reviewed and it indicated in view of destructive and hazardous role of pollution, it become necessary that the very nature of atmosphere, the various air effluent are present there to save the environment from the harmful effect. Effluent can be treated in different ways, it is classified as; preliminary treatment, primary treatment, secondary treatment and complete final treatment. Waste water obtained from industries is generally much more polluted than the domestic or even commercial waste water. Industrial wastewater cannot be always treated easily by the normal methods of treating domestic waste waters. Depending on the quantum, concentration, toxicity and presence of non biodegradable organics in an industrial wastewater, its treatment may consist of any one or more processes such as equalization, neutralization, physical treatment, chemical treatment and biological treatment. The atmosphere contains hundreds of air pollutants from natural or from anthropogenic sources. All such pollutants are called primary pollutants for example; sulphur oxides,

carbon monoxide, nitrogen oxides, lead etc. Secondary pollutants are the chemical substances, which are produced from the chemical reactions of primary pollutants or due to their oxidation etc. A high growth in vehicle population brings in its wake urban air pollution problems unless timely appropriate steps to control vehicle emissions are under taken. Some of the fundamentals of the book are quality and characteristics of effluents, collection of sewage samples for physical and chemical testing, disposing of effluents, disposal of wastewaters in lakes and management of lake waters, disposal of sewage effluents on land for irrigation, classification of treatment processes, treatment of industrial effluents, methods of treating industrial wastewaters, strategies for management of industrial wastes, combined industrial municipal wastes, a process for upgrading paper mill effluent by water hyacinth, ventilation for controlling indoor air pollution, the environment and its pollution, disposal of environmentally hazardous radioactive effluents and biomedical wastes, air pollution, its control and monitoring, fuels from waste etc. This book is an effort to put together the various options available to meet the water and air effluent available for the environmental protection. The book presents a concise but through an overview of state of technology for water and air effluent treatment. The water and air effluent treatments are organized into chapters by broad problem area, treatment of industrial effluent, industrial waste management, etc. This will be helpful to technocrats, consultants, educators, architects, industry executive, students and others concerned with saving environment problem.
